Description A homologous control antibody is an antibody that is used to co				
	target antibody in an experiment. The homologous control antibody should			
	have the same immunoglobulin type and concentration as the test			
	antibody, but not have the same specificity as the target antibody. It is			
	often used to help researchers distinguish between non-specific signals			
	and background signals in experiments to ensure the accuracy and			
	reliability of experimental results.
