Description	OX40 protein, also known as CD134, is a protein on the cell membrane belonging to the TNF receptor superfamily. It plays an important role in immune regulation, particularly in regulating T cell function. OX40 is a co-stimulatory molecule with its ligand being OX40L. When OX40 binds to its ligand OX40L, it activates signaling pathways, thereby promoting the survival, proliferation, and function of T cells. Studies have shown that utilizing OX40 protein as a target in immunotherapy can enhance anti-tumor immune responses, treat autoimmune diseases, and play a role in infectious diseases and transplant rejection reactions. Thus, OX40 protein and its signaling pathways are of significant importance in immune regulation and disease treatment.

SDS-PAGE

On SDS-PAGE under reducing (R) condition. The gel was stained overnight with Coomassie Blue. The purity of the protein is greater than 95%.
